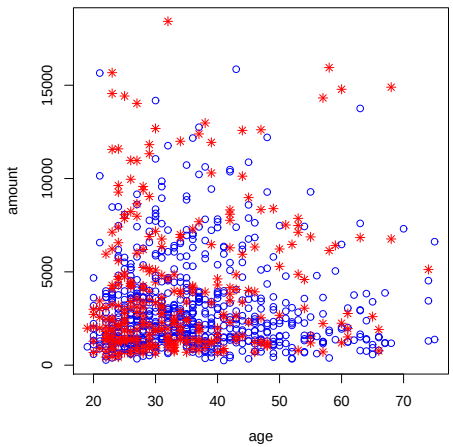
Introduction to R

Marlene Müller

Slides version: April 13, 2012



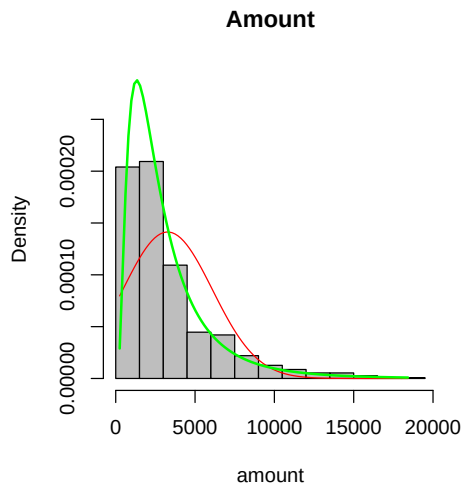


Table of contents

What is this R?

What is this R?

Programming Language S = developed at Bell Labs for statistics, simulation, graphics (Becker and Chambers, 1984)

- → S-PLUS: commerical implementation
- → R: implementation under GPL (GNU General Public License), open source
  - \+ interpreted program code, object orientation
  - \+ easily extensible by self-written routines, packages, DLLs
  - \+ many types of graphics (mainly static)
  - \+ standardized, simple-to-used data format ( `data.frame`)
  - \+ well developed format fo fitting (regression) models
  - \+ active developers team, helpful mailing list
  - \+ increasing number of books on R on the market
  - – (up to now) no “standard” GUI
  - – available routines/packages sometimes difficult to find

How do I start?

How do I start?

R is command-line oriented, so start simply by typing expressions like:

```
> 1+1
[1] 2

> 1+2*3^4
[1] 163

> x <- 1; y <- 2
> x+y
[1] 3
```

in the following all R Code is printed in a way that can be directly copied:

```
x <- seq(-pi,pi,by=0.1)
plot(x,sin(x),type="l",col="red",main="Sinuskurve")
```

Working with R under Unix/Linux

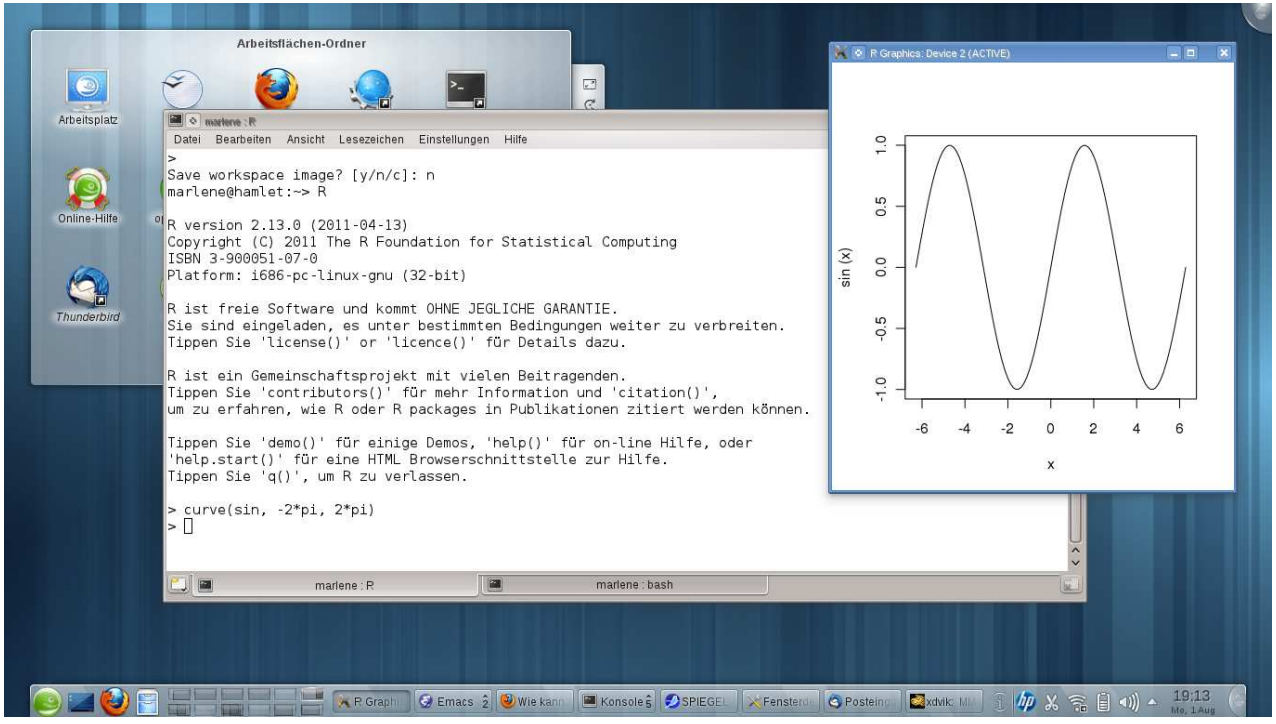

Figure: R in a Unix/Linux shell

R in a Windows desktop

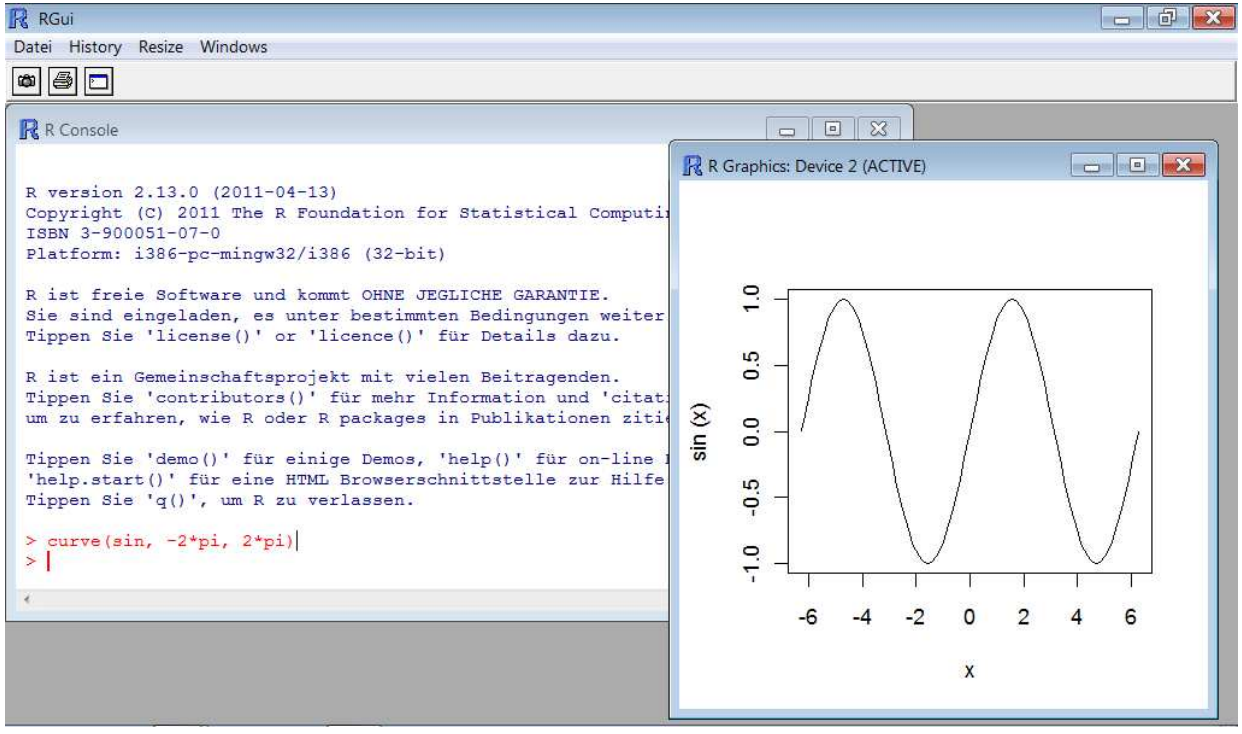

Figure: R in a Windows desktop

How to get help?

How to get help?

local help pages:

- help for a function:
  `help(<function name>)` or `?<function name>`
- help for a package:
  `library(help=<Package>)`

usually, the texts in the local help pages correspond to those in the package documentation

www

http://www.r-project.org

R home page, there are in particular FAQs as well as a Google site search, and additionally:

- manuals (http://cran.r-project.org/manuals.html)
  introduction, language definition, “Writing R Extensions” (DLLs, packages), introduction written in different languages (German, French, etc.)
- CRAN (http://cran.r-project.org)
  Comprehensive R Archive Network ($\rightarrow$ R software for download)
- mailing lists (http://www.r-project.org/mail.html)
- books list (http://www.r-project.org/doc/bib/R-books.html)
- conference announcements, related projects, . . .

Mailing lists

- R-help
  main list for R user questions, take care to read
  http://www.r-project.org/posting-guide.html before!
  $\rightarrow$ also available as a (usenet-) news group gmane.comp.lang.r.general
  auf http://news.gmane.org
- R-announce, R-packages, R-devel
  announcements, package announcements, developers list ($\rightarrow$ more for R specialists)
- R-sig-* (special interests groups)
  e.g. R-sig-finance = Special Interest Group for 'R in Finance'

for subscribing and archives see http://www.r-project.org/mail.html or http://news.gmane.org/index.php?prefix=gmane.comp.lang.r

helpful for search is http://www.rseek.org

Book selection (German & English)

data analysis:

- Wollschläger (2010): Grundlagen der Datenanalyse mit R
- Dalgaard (2002): Introductory Statistics with R
- Murrell (2005): R Graphics
- Venables and Ripley (2002): Modern Applied Statistics with S
  (R complements: http://www.stats.ox.ac.uk/pub/MASS4)

programming:

- Ligges (2009): Programmieren mit R
  (see also: http://www.statistik.uni-dortmund.de/∼ligges/PmitR/)
- Gentleman (2008): R Programming for Bioinformatics
- Venables and Ripley (2000): S Programming
  (see also: http://www.stats.ox.ac.uk/pub/MASS3/Sprog)

more books:

Some calculations to start with

Some calculations to start with

```
demo()
demo(graphics)   ## nice graphics ;-)
demo(persp)      ## nice 3D graphics ;-)
demo(image)      ## more nice graphics ;-)

x <- 1
x <- 0 -> y
x <- y <- z <- NA      ## missing
x <- 0/0               ## not a number (NaN)
x <- NULL              ## no value

x <- rnorm(100)        ## vector of 100 N(0,1) random variables

hist(x, col="orange")                    ## histogram
r <- hist(x, col="orange", freq=FALSE) ## same histogram?
g <- seq(-5,5,length=100)
ylim <- range(c(r$density,max(dnorm(g))))

hist(x, col="orange", freq=FALSE, ylim=ylim) ## same histogram?
lines(g, dnorm(g))                           ## with N(0,1) pdf
```

Useful tools

```
ls()                    ## list all R objects

x <- 1:3
x                       ## show object (vector: x)

print(x)                ## show object (vector: x), also within
                        ## R scripts and functions

fun <- function(x){ sin(x) }
fun                     ## show object (function: fun)

median                  ## show object (internal function: median)

rm(x)                   ## delete object x

save.image()            ## save workspace (.RData, .Rhistory)
load(".RData")          ## load workspace (.RData, .Rhistory)

date()                  ## date and time

q()                     ## quit R
```

Data types

numeric:

```
x <- 1
y <- pi      ## predefined pi = 3.1415926535898
```

character:

```
x <- "a"
y <- "my text"
```

logical:

```
x <- TRUE
y <- 1 > 2

> y
[1] FALSE
```

more complex data types can be constructed by combining these three simple types into vectors, matrices, arrays and lists

Vectors

```
x <- c(1,2,3)
x <- 1:3

y <- c(1,1,1)
y <- rep(2,10)

z <- as.character(1:3)
z <- c("a","b","c")

length(z)

names(x) <- z

x[2:3]
x["b"]
```

all elements of a vector are of the same type (numeric, character, logical)!

Matrices

```
x <- 1:20
x <- matrix(x, 5,4)    ## matrix(x, nrow=5,ncol=4)

x[2,3]
x[c(1,5),2:4]
x[,2:4]

dim(x)
nrow(x); ncol(x)

length(x)
as.vector(x)

dimnames(x) <- list(paste("row",1:nrow(x), sep=""),
                    c("a","b","c","d"))
x[,"b"]
x[,c("a","b")]
```

all elements of a matrix are of the same type (numeric, character, logical)!

Generating Vectors and Matrices

vectors from vectors:

```
x <- c(2,6,3)
y <- 1:3

c(x,y)                ## concatenate two vectors
c(x,1:5,y,6)          ## concatenate vectors and scalars
```

matrices from vectors:

```
x <- c(2,6,3)
y <- 1:3

cbind(x,y)            ## vertical concatenation
rbind(x,y)            ## horizontal concatenation

cbind(x,y,rep(0,3))   ## vertical concatenation
```

Arrays

```
x <- 1:60
x <- array(x, c(5,4,3))

x[2,3,1]
x[1,2:4,3]
x[,,1]

dim(x)
nrow(x)
ncol(x)

length(x)
as.vector(x)

dimnames(x) <- list(paste("row",1:nrow(x), sep=""),
                    c("a","b","c","d"),c("x","y","z"))
```

all elements of an array are of the same type (numeric, character, logical)!

Lists

```
x <- list(One=11:15, Two=c("a","b","c"), Three=(1:4)>0)
y <- list(x=x, Four=1:3)

x$One
y$x$One

y$Four
y[[2]]

length(x)
length(y)

y$Five <- names(x)
```

lists may contain objects of different type, these objects can be called with `$<name>` by name or with `[[<number>]]` by their number

Data frames

```
x <- data.frame(N=11:14, C=c("a","b","c","d"), L=(1:4)>0)

dim(x)
nrow(x); ncol(x)

length(x)
as.vector(x)

names(x)

x[2,3]
x[,2:3]

x[,2]
x[,"C"]
x$C
```

data frames can bee seen as lists, with all columns having the same length
$\rightarrow$ Excel tables, saved as .csv, are typically read into R as a (`data.frame`)

Operations (elementwise and/or vector-/matrixwise)

```
x <- matrix( 1:20, 5, 4)   ## 5x4 matrix

x+1; x-1; x*1; x/1         ## elementwise operations
sin(x); exp(x)             ## elementwise function calls

y <- 1:5
x * y                      ## elementwise multiplication

z <- 1:4
x %*% z                    ## matrix multiplication

min(x)                     ## minimum of all elements of x
apply(x,1,min)             ## row minima
apply(x,2,min)             ## column minima

y <- c(TRUE, TRUE, FALSE, FALSE)
y & TRUE                   ## elementwise logical "AND"
y | FALSE                  ## elementwise logical "OR"
!y                         ## elementwise logical "NOT"

y && TRUE                  ## here only the first result
y || FALSE                 ## holds! ("AND" or "OR")
```

Data & files

Data & files

example file in Excel:

	A	B	C	D	E	F	G	H
1	Kunde	Eigenkapital	Liquidität	Ausfall	Datum	Ratingpunkte	Ratingklasse	
2	Meier	10	30	0	01.11.2004	100	1	
3	Schulze	30	40	0	02.10.2004	70	2	
4	Lehmann	20		1	03.12.2004	30	3	
5	Schmidt	10	20	0	04.09.2004	20	4	
6								
7								
8								

→ save under Excel as CSV: Example1.csv

```
Kunde;Eigenkapital;Liquidität;Ausfall;Datum;Ratingpunkte;Ratingklasse
Meier;10;30;0;01.11.2004;100;1
Schulze;30;40;0;02.10.2004;70;2
Lehmann;20;;1;03.12.2004;30;3
Schmidt;10;20;0;04.09.2004;20;4
```

Reading and saving CSV files

reading the file Example1.csv:

```
x <- read.csv("Example1.csv", sep=";")

dim(x)
names(x)
x
```

result in R:

```
    Kunde Eigenkapital Liquidität Ausfall      Datum Ratingpunkte Ratingklasse
1   Meier           10         30       0 01.11.2004          100            1
2 Schulze           30         40       0 02.10.2004           70            2
3 Lehmann           20         NA       1 03.12.2004           30            3
4 Schmidt           10         20       0 04.09.2004           20            4
```

saving the data to Example2.csv:

```
write.table(x,file="Example2.csv",sep=";",row.names=FALSE,quote=FALSE)
```

More functions for data input and output

functions for reading data:

- `read.table` (ASCII data)
- `scan` (scans any text file, further postprocessing necessary)

functions to convert data:

- `as.numeric`, `as.character`, `as.factor`, `as.Date`

other possibilities to communicate to Excel:

- `RODBC` (accessing data from databases)
- R-Excel-interface via DCOM server (http://cran.at.r-project.org/contrib/extra/dcom)

R script files

run a script with R code:

```
> source("MyProgram.R")
```

saving R output to file:

```
sink("MyOutput.txt") ## from now all output goes to file
sink()               ## and now to the screen again
```

Random numbers and probability distributions

examples for the normal distribution:

`rnorm(n, mean=0, sd=1)`	pseudo-random numbers
`dnorm(x, mean=0, sd=1)`	density (pdf)
`pnorm(x, mean=0, sd=1)`	cumulative distribution function (cdf)
`qnorm(p, mean=0, sd=1)`	quantiles

in the same manner:

uniform distribution	`{r|d|p|q}unif`	*t* distribution	`{r|d|p|q}t`
lognormal distribution	`{r|d|p|q}lnorm`	gamma distribution	`{r|d|p|q}gamma`
χ^2 distribution	`{r|d|p|q}chisq`	beta distribution	`{r|d|p|q}beta`
binomial distribution	`{r|d|p|q}binom`	poisson distribution	`{r|d|p|q}pois`
exponential distribution	`{r|d|p|q}exp`	*F* distribution	`{r|d|p|q}f`

...

$\rightarrow$ it is possible to fix the seed by `set.seed`

Example: Normal- vs. t distribution

```
x <- rnorm(100)
mean(x)
sd(x)

plot(rnorm(10000), rnorm(10000))

x <- seq(-5,5,by=0.1)
plot(x, dnorm(x), type="l", col="black", lwd=2)
lines(x, dt(x, df=1), col="blue")
lines(x, dt(x, df=5), col="orange")
lines(x, dt(x, df=20), col="red")

qnorm(0.95)
qnorm(0.975)
```

Multivariate normal distribution

```
library(help=mvtnorm)
library(mvtnorm)

mu <- c(0,0)     ## means
sigma <- c(1,1)  ## standard deviations
rho <- 0.5       ## correlation

S <- matrix(NA, 2,2)
diag(S) <- sigma^2
S[1,2] <- S[2,1] <- rho*prod(sigma)

x <- rmvnorm(n=10000, mean=mu, sigma=S)
plot(x)

x <- seq(-5*sigma[1]+mu[1], 5*sigma[1]+mu[1], length = 50)
y <- seq(-5*sigma[2]+mu[2], 5*sigma[2]+mu[2], length = 50)
f <- function(x,y) { dmvnorm(cbind(x,y), mean=mu, sigma=S) }
z <- outer(x, y, f)
persp(x, y, z, theta = 10, phi = 20, expand = 0.5,
      col = "lightblue", shade = 0.75)
```

Wonderful world of graphics

Wonderful world of graphics

credit scoring data:

http://www.stat.uni-muenchen.de/service/datenarchiv/kredit/kredit_e.html

```
file <- read.csv("D:\\kredit.asc",sep=" ")
y <- 1-file$kredit        ## default set to 1

prev    <- (file$moral >2)+0                ## previous loans were OK
employ  <- (file$beszeit >1)+0              ## employed (>=1 year)
dura    <- (file$laufzeit)                  ## duration
d9.12   <- ((file$laufzeit >9)&(file$laufzeit <=12)) +0 ##  9-12 months
d12.18  <- ((file$laufzeit >12)&(file$laufzeit <=18))+0 ## 12-18 months
d18.24  <- ((file$laufzeit >18)&(file$laufzeit <=24))+0 ## 18-24 months
d24     <- (file$laufzeit >24)+0                        ##  > 24 months
amount  <- file$hoehe                       ## amount of loan
age     <- file$alter                       ## age of applicant
savings <- (file$sparkont > 4)+0            ## savings >= 1000 DM
phone   <- (file$telef==1)+0                ## applicant has telephone
foreign <- (file$gastarb==1)+0              ## non-german citizen
purpose <- ((file$verw==1)|(file$verw==2))+0    ## loan is for a car
house   <- (file$verm==4)+0                 ## house owner
```

Barplots

→ graphical representation of the frequency distribution for discrete variables

```
table(dura)          ## frequency table

barplot(table(dura), col="cyan", main="Duration of Loan")
                     ## absolute frequencies

n <- length(dura)
barplot(table(dura)/n, col="cyan", main="Duration of Loan")
                     ## relative frequencies

par(mfrow=c(1,3))   ## graphical display with 1 row, 3 columns

barplot(table(dura),    col="cyan",    main="Duration of Loan")
barplot(table(savings), col="orange",  main="Savings >1000 DM")
barplot(table(house),   col="magenta", main="House Owner")

par(mfrow=c(1,1))   ## reset display to single plot
```

Example: Barcharts

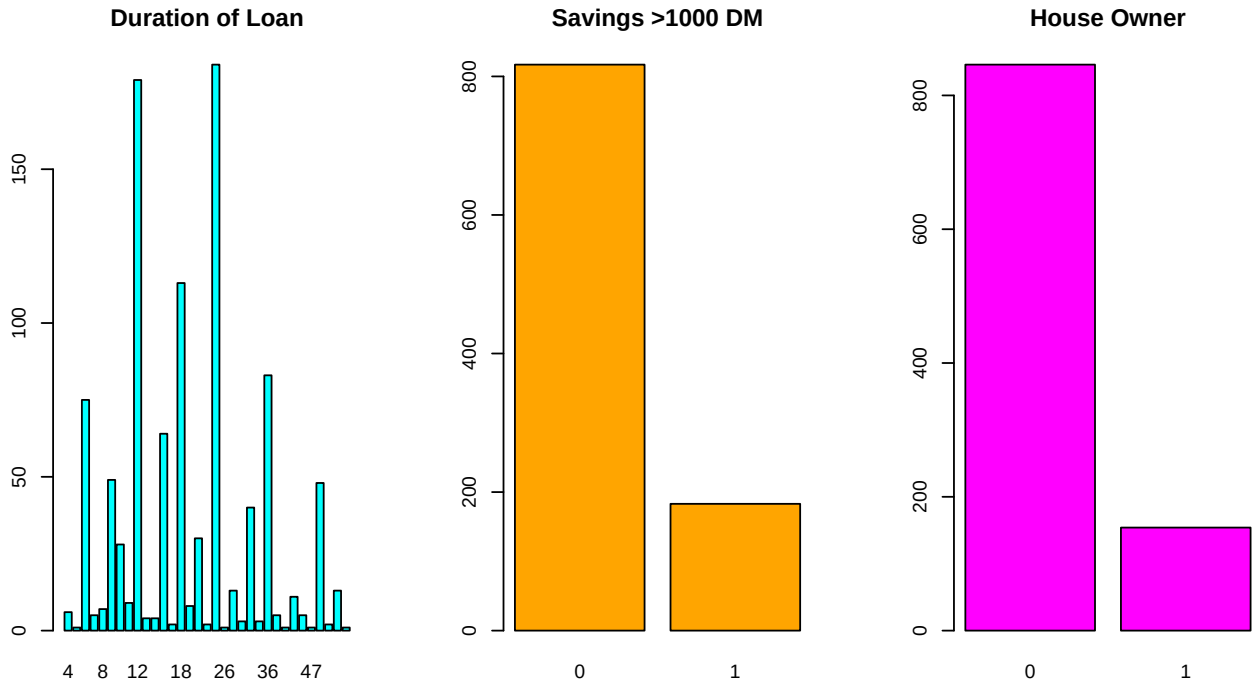

Figure: Examples for bar plots: duration of loan (left), savings (center) and house-owner indicator (right)

Boxplots

→ graphical representation of outliers, minima/maxima, 25%-, 50%-, and 75%-quantiles

```
boxplot(age)
boxplot(age, horizontal=TRUE)

boxplot(age, col="gray",horizontal=TRUE)

boxplot(age ~ y, col=c("gray","red"),
        horizontal=TRUE, main="Age vs. Y")
boxplot(amount ~ y, col=c("gray","red"),
        horizontal=TRUE, main="Amount vs. Y")
```

Examples: Boxplots

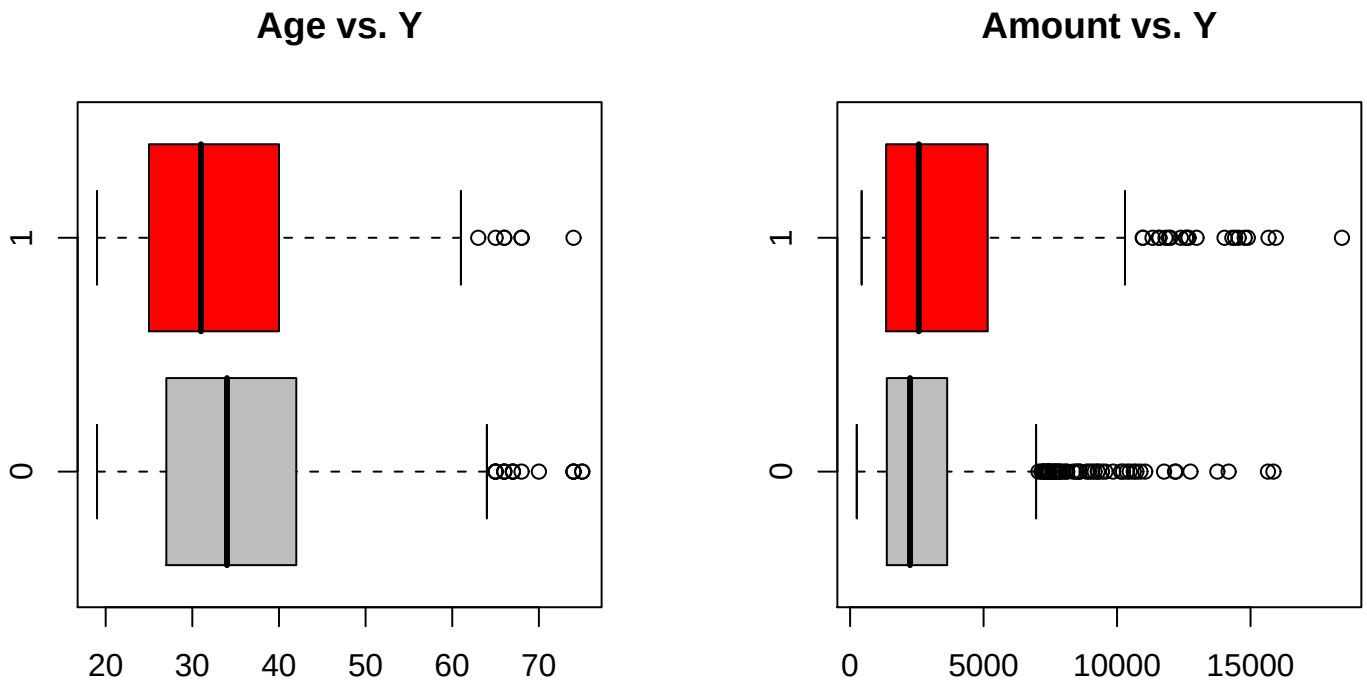

Figure: Age of credit applicant (left) and amount of loan (right) vs. default indicator (1 = default, 0 = non-default)

Histograms

→ graphical representation of the distribution (probability density function) of continuous variables

```
hist(age)
hist(age, freq=FALSE)
hist(age, freq=FALSE, col="gray")

hist(amount, freq=FALSE, col="gray",    main="Amount")
xx <- seq(min(amount),max(amount), length=100)
lines(xx, dnorm(xx, mean(amount), sd(amount)), col="red")
lines(xx, dlnorm(xx, mean(log(amount)), sd(log(amount))), col="green", lwd=2)

## smaller intervals and better vertical scale
b  <- seq(0,20000,by=1500)                    ## new intervals
h  <- hist(amount, freq=FALSE, breaks=b, plot=FALSE)
                                              ## histogram without display
xx <- seq(min(amount),max(amount), length=100)
d1  <- dnorm(xx, mean(amount), sd(amount))    ## normal pdf
d2  <- dlnorm(xx, mean(log(amount)), sd(log(amount)))
                                              ## lognormal pdf
ylim <- range( c(h$density, d1, d2) )

hist(amount, freq=FALSE, breaks=b, col="gray", main="Amount", ylim=ylim)
lines(xx, d1, col="red")
lines(xx, d2, col="green", lwd=2)
```

Example: Histogram

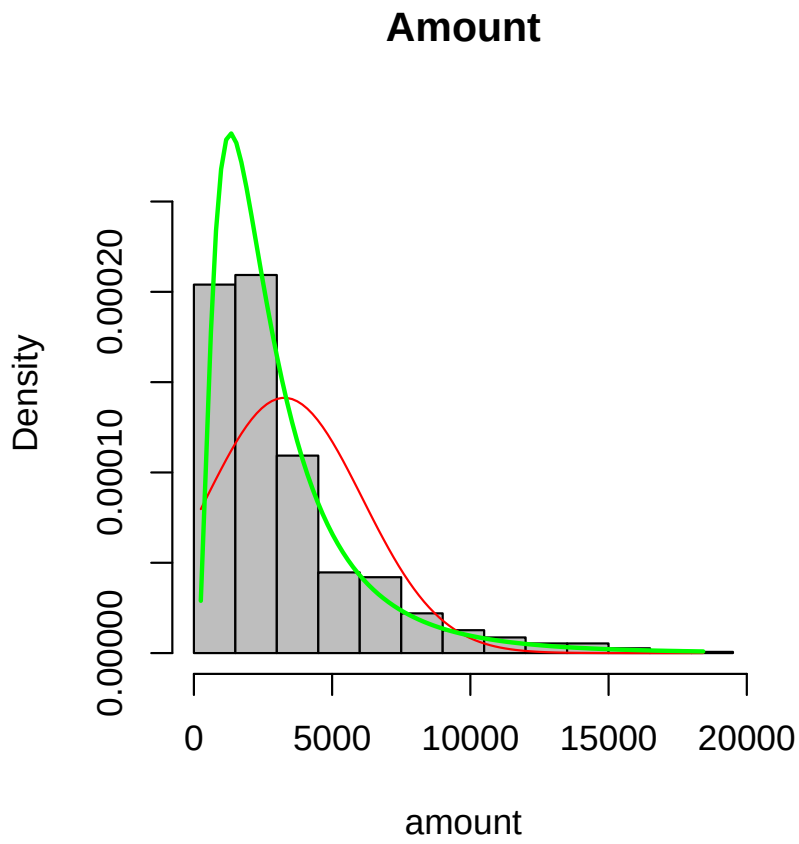

Figure: Probability distribution of the amount of the loan, histogram in comparison with normal and lognormal pdfs

Scatterplots

```
plot(age, amount)

color <- 1*(y==1) + 2*(y==0)
plot(age, amount, col=color)

color <- rep("", length(age))
color[y==1] <- "red"
color[y==0] <- "blue"
plot(age, amount, col=color)

plot(1:20,1:20,col=1:20, pch=1:20)
text(1:20,1:20,labels=as.character(1:20), pos=4)

symbol <- 8*(y==1) + 1*(y==0)
plot(age, amount, col=color, pch=symbol)
```

Scatterplots and curves

```
x <- seq(-pi,pi,length=100)
plot(x, sin(x), type="l")
lines(x, cos(x), col="red")

logit <- glm(y ~ age, family=binomial(link = "logit"))

plot(age, logit$fitted.values)

plot(age, logit$fitted.values, type="l")
                          ## not this way ...

o <- order(age)
plot(age[o], logit$fitted.values[o], type="l")
                          ## ... but that way! (sort data first)

plot(age[o], logit$fitted.values[o], type="l", lwd=2, ylim=c(0,1))
title("PDs")
points(age, y, col="red", pch=3, cex=0.5)
```

Example: scatterplots and curves

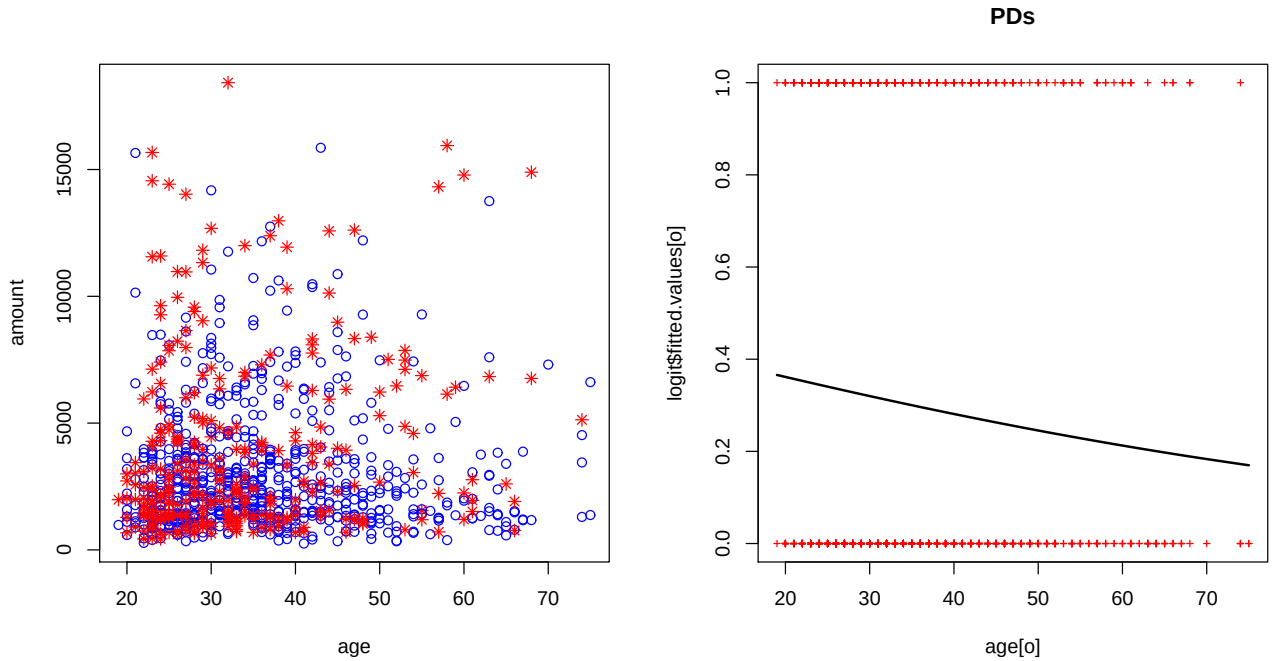

Figure: Scatterplot of age vs. amount (left), logit probabilities of default (right)

Surfaces, point clouds, contours

```
## bivariate normal pdf
library(mvtnorm)
x <- y <- seq(-5, 5, length = 50)
f <- function(x,y) { dmvnorm(cbind(x,y)) }
z <- outer(x, y, f)
persp(x, y, z, theta=10, phi=20, expand=0.5, col="lightblue")
persp(x, y, z, theta=10, phi=20, expand=0.5, col="lightblue",
      shade = 0.75)

## contours of the bivariate normal pdf
x <- y <- seq(-5, 5, length = 150)
z <- outer(x, y, f)
contour(x, y, z, nlevels=20)
contour(x, y, z, nlevels=20, col=rainbow(20))
contour(x, y, z, nlevels=20, col=rainbow(20), labels="")

## 3-dimensional normal data
library(scatterplot3d)
x <- matrix(rnorm(15000),ncol=3)
scatterplot3d(x)
scatterplot3d(x, angle=20)
```

Surfaces, point clouds, contours

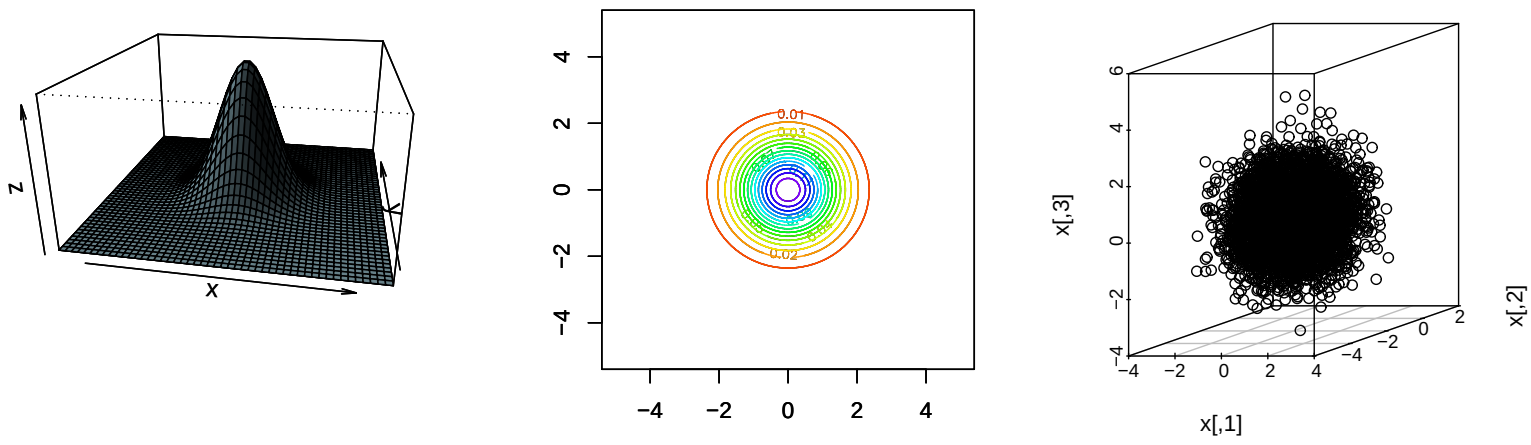

Figure: Bivariate normal pdf: 3D plot of the pdf (left), contour curves (center); 3D scatterplot (right)

Arranging plots

directly within the plot routines: → obtain help by `?par`

- set colors with `col=...` (generate colors by → `?rainbow`, `?rgb`, `?col2rgb`)
- set symbol style with `pch=...`, symbol size with `cex=...`
- set plot title with `main=...`, axes lables with `xlab=...`, `ylab=...`
- set plot drawing limits with `xlim=...`, `ylim=...`

after drawing a plot:

- add curves and points with `lines(...)` bzw. `points(...)`
- add labels (text) with `text(...)`
- add title with `title(...)`
- add legend with `legend(...)`

Save plots to files

- PostScript:

```
x <- matrix(rnorm(5000),ncol=2)
plot(x)
postscript("MyPlot.eps", width=5, height=4, horizontal=FALSE)
plot(x)
dev.off()
```

- other formats are e.g. pdf, pictex, xfig, png, jpeg
  → see ?Devices

Some statistics

Some statistics

credit scoring data:

http://www.stat.uni-muenchen.de/service/datenarchiv/kredit/kredit_e.html

```
file <- read.csv("D:\\kredit.asc",sep=" ")
y <- 1-file$kredit        ## default set to 1

prev    <- (file$moral >2)+0                ## previous loans were OK
employ  <- (file$beszeit >1)+0              ## employed (>=1 year)
dura    <- (file$laufzeit)                  ## duration
d9.12   <- ((file$laufzeit >9)&(file$laufzeit <=12)) +0 ##  9-12 months
d12.18  <- ((file$laufzeit >12)&(file$laufzeit <=18))+0 ## 12-18 months
d18.24  <- ((file$laufzeit >18)&(file$laufzeit <=24))+0 ## 18-24 months

“Advanced” mathematics

Optimizing functions

example: linear model

$$y_i = \beta_0 + \beta_1 x_{i1} + \beta_2 x_{i2} + \varepsilon_i$$

generate artificial data:

```
n <- 100; b <- c(-1,3)
x <- matrix(rnorm(n*length(b)),ncol=length(b))
                                        ## regressors
e <- rnorm(n)/4

y <- 1 + x %*% b + e                    ## linear model

l <- lm( y~x ); summary(l)              ## built-in lm
```

$\rightarrow$ to optimize:

$$QS = \sum_i (y_i - x_i^\top \beta)^2$$

(agreed, this is not a very useful example for iterative optimization ;-)

Optimizing functions (cont'd)

optimization (without intercept):

```
QS <- function(b, x, y){ sum( (y - x %*% b)^2 ) }
                                        ## objective function

b0 <- c(0,0)
opt <- optim(b0, QS, method="BFGS", x=x, y=y)
                                        ## optimization
opt
sum( (x %*% opt$par - mean(y))^2 )/sum( (y-mean(y))^2 )   ## R^2
```

$\rightarrow$ coefficient of determination R^2 might be outside $[0, 1]$

optimization (with intercept):

```
b1 <- c(0,0,0)
x1 <- cbind(rep(1,n),x)
opt1 <- optim(b1, QS, method="BFGS", x=x1, y=y)
                                        ## optimization
opt1
sum( (x1 %*% opt1$par - mean(y))^2 )/sum( (y-mean(y))^2 ) ## R^2
```

Optimizing functions (cont'd)

optimization with gradient:

$$QS = \sum_i (y_i - x_i^\top \beta)^2 = (y - \mathcal{X}\beta)^\top (y - \mathcal{X}\beta), \quad \frac{\partial QS}{\partial \beta} = -2\mathcal{X}^\top y + 2\mathcal{X}^\top \mathcal{X}\beta$$

```
D.QS <- function(b, x, y){ -2* t(x) %*% y + 2* t(x) %*% x %*% b }
                                          ## gradient

opt2 <- optim(b1, QS, D.QS, method="BFGS", x=x1, y=y)
opt2
sum( (x1 %*% opt2$par - mean(y))^2 )/sum( (y-mean(y))^2 ) ## R^2
```

optimization with box constraints (e.g. $\beta_j \geq 0$):

```
b2 <- c(0,0,0)
x1 <- cbind(rep(1,n),x)
opt3 <- optim(b1, QS, D.QS, method="BFGS", lower=0, x=x1, y=y)
opt3
sum( (x1 %*% opt3$par - mean(y))^2 )/sum( (y-mean(y))^2 ) ## R^2
```

Optimizing functions (cont'd)

optimization with linear constraints (z.B. $\beta_0 \geq 0$, $\beta_1 + \beta_2 \leq 2$):

$$\mathcal{U}\beta - c = \begin{pmatrix} 0 & -1 & -1 \\ 1 & 0 & 0 \end{pmatrix} \begin{pmatrix} \beta_0 \\ \beta_1 \\ \beta_2 \end{pmatrix} - \begin{pmatrix} -2 \\ 0 \end{pmatrix} \geq 0$$

```
u <- cbind( c(0,1), c(-1,0), c(-1,0) )
c <- c(-2,0)

applyDefaults <- function(fn, ...) { ## for transferring further
  function(x) fn(x, ...)             ## parameters to QS and D.QS
}

b4 <- rep(0.5,3)
opt4 <- constrOptim(b4, applyDefaults(QS, x=x1, y=y),
                    applyDefaults(D.QS, x=x1, y=y), ui=u, ci=c)
opt4
sum( (x1 %*% opt4$par - mean(y))^2 )/sum( (y-mean(y))^2 ) ## R^2
```

Interpolation

→ `approx` for linear, `spline` and `interpSpline` for spline approximation

```
x <- seq(-5,5,by=1)
y <- sin(x)

xx <- seq(-5,5,by=0.1)
y.approx <- approx(x,y, xout=xx)$y
yy <- sin(xx)

plot(xx,yy, type="l", col="green")
lines(xx,y.approx, lwd=2)

library(splines)
sp <- interpSpline(x,y)
lines(predict(sp,xx), col="red")
```

Numerical integration

→ `integrate` for 1-dimensional integration
→ `adapt` for multidimensional integration

```
pnorm(0)

it <- integrate(dnorm, -Inf,0)
it
attributes(it)   ## result is object of class "integrate"

it$value

pmvnorm(c(0,0))
pmvnorm(c(0,0))[[1]]

library(adapt)
it <- adapt(2, c(-Inf,-Inf), c(0,0), functn=dmvnorm)

attributes(it)   ## result is object of class "integration"

it$value
```

Basics in programming

Functions in R

```
myfun <- function(x, a){
  r <- a*sin(x)
  return(r)
}
myfun(pi/2,2)

myfun1 <- function(x, a){ a*sin(x) }  ## same as myfun
myfun1(pi/2,2)

myfun2 <- function(x, a=1){     ## optional parameter with
  a*sin(x)                      ## default value=1
}
myfun2(pi/2,2)
myfun2(pi/2)

myfun3 <- function(x, a=NULL){  ## optional parameter
                                ## without default value
  if (!is.null(a)){ a*sin(x) }else{ cos(x) }
}
myfun3(pi/2,2)
myfun3(pi/2)
```

Functions in R (cont'd)

```
myfun4 <- function(x, a=1){
  r1 <- a*sin(x); r2 <- a*cos(x)
  return(list(r1=r1,r2=r2))   ## result is a list
}
myfun4(pi/2)

myfun5 <- function(x, a=1, b=2){
  r1 <- a*sin(x); r2 <- b*cos(x)
  return(list(r1=r1,r2=r2))
}
myfun5(pi/2)              ## a=1, b=2 (defaults)
myfun5(pi/2,1,2)          ## a=1, b=2 (explicitely given)

myfun5(pi/2,2)            ## a=2, b=2 (only a explicitely given)
myfun5(pi/2,a=2)          ## a=2, b=2 (only a explicitely given)

myfun5(pi/2,b=3)          ## a=1, b=3 (only b explicitely given)
```

$\rightarrow$ input parameters may be omitted (if reasonable); multiple output parameters are in fact elements of a list

Conditional instructions, loops

- if & else

```
x<- 1; if (x==2){ print("x=2") }
x<- 1; if (x==2){ print("x=2") }else{ print("x!=2") }
```

- for & repeat

```
for (i in 1:4){ print(i) }
for (i in letters[1:4]){ print(i) }
i <- 0; while(i<4){ i <- i+1; print(i)}
i <- 0; repeat{ i <- i+1; print(i); if (i==4) break }
```

- other: ifelse, switch

“Set theory”

```
A <- 1:3     ## vector as a "set"
B <- 2:6     ## vector as a "set"
A %in% B
B %in% A

C <- c("A","B")
D <- LETTERS[2:6]
C %in% D
D %in% C
```

Packages

- packages comprise (one or) more functions, are loaded with `library(<Package-Name>)`; available functions in a package can be queried with `library(help=<package-name>)`
- to create self-written packages, there exist two helpful functions:

  `package.skeleton(<package-name>)`
  generates the appropriate directory structure of the packages with templates for the necessary files
  `prompt(<Funktion>)`
  generates a template for the help text for a function

- packages may be installed with the according menu item under Windows or with `install.packages`
- packages covering a specific topic can be found under **task views** ($\rightarrow$ http://cran.at.r-project.org/web/views/), to install a task view use e.g.:

```
install.packages("ctv")
library("ctv")
update.views("Econometrics")
```

DLLs

→ manual “Writing R Extensions”
(http://cran.at.r-project.org/doc/manuals/R-exts.pdf)

example of a simple C function under Unix/Linux:

```
#include <stdlib.h>
#include <math.h>

/* Compile shared library: gcc -shared -O2 -o mydll.so mydll.c */

int mysum(double *dim, double *x, double *y, double *z)
{
    long i, n;
    n=dim[0];

    for (i=0; i<n; i++)   /* loop over obs  */
    {
        z[i] = x[i] + y[i];
    }
    printf ("mysum in C\n");
    return 0;
}
```

DLLs: call from R

```
dyn.load("mydll.so")           ## load the DLL
is.loaded("mysum")             ## is "mysum" available?

d <- 3
x <- 1:3
y <- 4:6
z <- rep(0,3)

r <- .C("mysum", dim=d, x=x, y=y, z=z )   ## that doesn't work!
r$z

d <- as.double(3); x <- as.double(1:3)
y <- as.double(4:6); z <- rep(0.0,3)
r <- .C("mysum", dim=d, x=x, y=y, z=z )   ## this works!
r$z
z                              ## z is still =0

r <- .C("mysum", dim=d, x=x, y=y, z=z, DUP=FALSE)
                               ## another way (without copying)
r$z
z                              ## z contains the result

dyn.unload("mydll.so")         ## unload the DLL
```

Tips & tricks

editors:

- Windows: TinnR (http://sciviews.org/Tinn-R/)
- Windows/Unix/Linux: ESS = “Emacs speaks statistics” from http://ess.r-project.org/ and add a line to `.emacs`:
  `(load "<path to ESS>/ess-5.1.24/lisp/ess-site")`
- syntax highlightening for Windows is also available in WinEdt (http://cran.r-project.org/web/packages/RWinEdt/index.html)

alternative R GUIs:

- R Commander (http://socserv.mcmaster.ca/jfox/Misc/Rcmdr/) is a menu-assisted environment for data analysis, can be installed by:

  ```
  install.packages("Rcmdr")
  ```

- R Studio (http://rstudio.org/) is an alternative GUI, available for different OS

R Commander

```
library(Rcmdr)
```

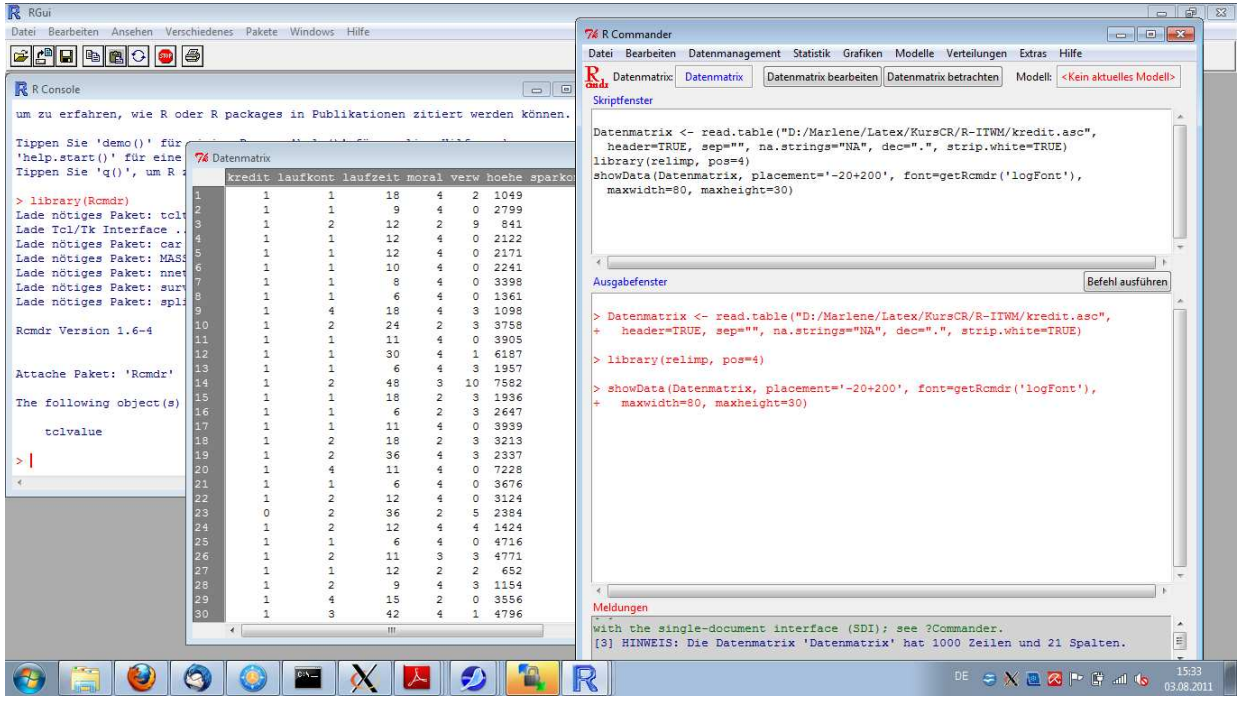

Figure: R Commander screenshot

Tips & tricks (cont'd)

programming:

- Reval and `parse` evaluate strings as expressions, e.g.:

```
eval(parse(text=paste("x.",as.character(1:2)," <- 0",sep="")))
print(x.1)
```

- there are two methods for OOP in R: S3- and S4-classes; for obtaining information about the components of a S3 class (former approach) one uses `class` and `attributes` while for a S4 class (newer approach) `getClass`, `slot`, `slotNames` are useful
- methods can be class-dependent, e.g. `methods(print)` gives all functions belonging to the print function

Tips & tricks (cont'd)

diverse tips:

- rounding and formatting of numbers works with `round`, `floor`, `ceiling`, `signif`, `formatC`
- strings (character vectors) can be edited with `paste`, `substr`, `nchar`, `strsplit`, `toupper`, `tolower`, `sub`
- time dates can be generated with `as.POSIXlt` and `strptime`, e.g.
  `as.POSIXlt( strptime("20050101","%Y%m%d"))+(0:364)*86400`
  creates all days of the year 2005;
  `d <- as.POSIXlt( strptime("20050926","%Y%m%d")); d$wday`
  shows the weekday of Sep 26, 2005
- `system` executes an OS command, e.g. under Linux
  `system("cal 09 2005")`
- `xtable` (package: `xtable`) and `latex` (package: `Hmisc`) can save R object into LaTeX code
